ABSTRACT OF THE DISCLOSURE

A phase θc of a correction unbalance found by the following formula (1) is determined by using a Radial Runout (RRO) value Wr1 in a primary component of the RRO of the wheel rim, a phase $\theta r1$ (unit: °) of a peak position thereof, an unbalance level Wub of a heavy point of the wheel rim, a phase θub thereof, a distance L of a balance weight sticking position, a weight Tt of the tire, and a phase αt of a light point of the tire. The tire and the wheel rim are assembled in a state of aligning the phase θc of the correction unbalance with the phase αt of the light point of the tire.

 $\theta c = Tan^{-1}[[Wub \times Sin \theta ub + \{(Wr1 \times Tt)/(2 \times L)\} \times Sin \theta r1]/[Wub \times Cos \theta ub + \{(Wr1 \times Tt)/(2 \times L)\} \times Cos \theta r1]] ... (1)$
